Task 1.1: Market Research & Problem Definition

A. Market Research

Conduct simple market research by answering the following questions. Use statistical data and justifications to support your answers:

What specific problems can my product or service solve for consumers?

My product, an **image classification model for plant health**, solves several key problems for consumers, particularly those interested in plant care, such as:

- **Plant Health Monitoring**:

  Consumers often struggle to diagnose plant diseases or health issues without professional knowledge. This model helps identify whether a plant is healthy or unhealthy, reducing the need for expert intervention.

- **Early Disease Detection**:

  The model detects early signs of diseases or conditions like yellowing leaves or pest damage, allowing consumers to take corrective actions before the problem worsens.

- **Time and Effort Saving**:

  Instead of manually researching or seeking advice for each plant issue, consumers can quickly get results by simply uploading an image. This saves time and reduces the effort required to care for their plants.

- **Accessibility to Non-Experts**:

  It provides easy access to plant care knowledge, making plant health monitoring accessible even to beginners without a green thumb.

  Supporting data could include studies or surveys indicating how many people struggle with plant care and how much time they spend researching plant problems. Additionally, as the number of plant enthusiasts grows, tools like this model could offer significant value by streamlining plant care routines.

- What gaps or challenges exist in the current market or among competitors?
- Despite the increasing popularity of plant care tools, there are several gaps and challenges in the market that my product can address:
- **Lack of Accuracy and Reliability in Existing Tools**:
- **Problem**: Many existing plant diagnosis apps or websites rely on user input or general symptom-based analysis, which can lead to inaccurate results. They often provide generic advice that may not be suitable for all plant types or conditions.
- **Opportunity**: My image classification model offers a more accurate and reliable approach, using AI to analyze actual plant images, making diagnoses more specific to individual plants.
- **Limited Scope of Diagnosis**:
- **Problem**: Most plant care tools focus on a narrow set of diseases or conditions, typically addressing common issues like pests or fungal infections. They often fail to detect early-stage problems or subtle symptoms.
- **Opportunity**: The model can detect a wide range of plant health issues, from minor pest infestations to nutritional deficiencies, providing a comprehensive tool for plant health monitoring.
- **Complexity of Use**:
- **Problem**: Some existing tools and services require users to be familiar with advanced gardening knowledge or complicated interfaces, making them inaccessible to beginner gardeners.
- **Opportunity**: My product is designed to be user-friendly, with simple steps: take a picture, upload it, and get immediate feedback. This simplicity allows even beginners to easily monitor their plants.
- **Inadequate Integration with Modern Technology**:
- **Problem**: Many plant care tools are not integrated with modern technology, such as smartphones or smart home systems. This makes them less accessible to a tech-savvy audience.

- **Opportunity**: The model is designed to be accessible via smartphones and web applications, fitting seamlessly into users' daily lives and providing immediate plant health insights on-demand.
- **Limited Data and Personalization**:
- **Problem**: Existing plant care tools often lack personalized feedback. They provide generalized care tips based on basic plant types, but they don't consider individual environmental conditions or plant history.
- **Opportunity**: The model can be adapted to take into account various plant species, growth stages, and environmental factors (e.g., sunlight, humidity), offering a more personalized and targeted care plan for each plant.
- **Lack of Preventive Solutions**:
- **Problem**: Many tools focus on fixing problems once they arise, but they don't offer preventative measures or proactive plant care strategies.
- **Opportunity**: This model can be used not only for diagnosing plant issues but also for predicting potential future problems based on early symptoms, helping users take preventive actions.
- **High Cost of Expert Advice**:
- **Problem**: Accessing professional gardening advice can be expensive or time-consuming, especially in remote areas or for rare plant species.
- **Opportunity**: My product provides an affordable, easily accessible alternative for consumers to get expert-level advice without needing to consult a professional.

By addressing these gaps, my product can offer a more accurate, accessible, and user-friendly solution to plant health monitoring, setting it apart from current competitors in the market.

- Are existing products or services meeting consumer expectations? If not, what are they lacking?

Existing plant health monitoring tools and services are not fully meeting consumer expectations for several reasons:

1. **Lack of Accuracy**:
    - Many apps or services that diagnose plant health based on user input or symptom descriptions tend to be inaccurate, leading to frustration among users.
    - **Lack**: They often provide generalized advice, which may not address the specific issue a plant is facing.
    - **Expectation**: Consumers expect accurate, data-driven diagnoses based on actual plant images.
2. **Limited Scope**:
    - Many plant care tools only cover common diseases or pests and do not offer a comprehensive analysis of plant health. They may miss subtle symptoms or early-stage issues.
    - **Lack**: Existing tools are limited in the range of conditions they can diagnose.
    - **Expectation**: Consumers want a tool that can address a wide variety of health issues, including minor and early-stage symptoms.
3. **Complexity and Usability**:
    - Some tools have complex interfaces or require users to input detailed information about their plants. This makes them less accessible to beginners or casual plant owners.
    - **Lack**: Ease of use is often lacking, making these tools more suitable for advanced users than everyday plant enthusiasts.
    - **Expectation**: Consumers desire a simple, user-friendly interface that works with minimal effort.
4. **Slow Response Time**:
    - Many existing services, especially those relying on experts, can take a long time to deliver responses. Users may have to wait for a professional to review their plant images or answer their questions.
    - **Lack**: Instant feedback is missing, leading to delays in addressing plant issues.
    - **Expectation**: Consumers want immediate results when diagnosing plant health, ideally through an AI-powered, automated system.
5. **Inconsistent Data and Personalization**:
    - Many plant care solutions provide one-size-fits-all advice that does not take into account individual plant species, environmental factors, or previous plant conditions.
    - **Lack**: There is a lack of personalized care, with most tools offering generic tips that don't account for the unique needs of a particular plant.

- **Expectation**: Consumers expect personalized and tailored advice that considers their specific plant species, growth stage, and environment.

6. **High Cost of Expert Advice**:
    - Professional plant health consultations can be costly, especially for individuals who don't have easy access to experts.
    - **Lack**: Affordable, expert-level advice is often unavailable.
    - **Expectation**: Consumers desire an affordable alternative to expert consultations that provides expert-level insights without the high cost.
7. **Preventive Solutions**:
    - Most tools focus on diagnosing problems after they occur but do not offer ways to prevent potential issues or provide early warnings.
    - **Lack**: Preventive care and early detection are not prioritized.
    - **Expectation**: Consumers expect tools that help prevent plant problems by providing early warnings and offering proactive solutions.

.

B. Problem Definition

Based on the research conducted, create a problem definition. Justify it using conducted market research and statistical data.

- **Problem Definition**

Consumers, particularly plant owners, struggle with accurately diagnosing plant health issues and taking timely action. Existing solutions often provide inaccurate diagnoses, lack comprehensive coverage of plant conditions, and are not user-friendly, especially for beginners. Many plant owners spend excessive time researching plant problems, and expert consultations can be costly or difficult to access.

Justification:

- **Market Demand**: 35% of plant owners find it difficult to diagnose plant diseases (National Gardening Association), and 40% spend over an hour each week on plant care research (Royal Horticultural Society).
- **Growing Interest**: 70% of Millennials and Gen Z in urban areas are involved in indoor gardening (National Gardening Association), driving demand for efficient, accessible plant care solutions.
- **Time and Cost**: Consumers need faster, affordable solutions, as expert consultations are often not readily available.

This problem creates a gap for an easy-to-use, accurate, and affordable plant health diagnostic tool that provides fast results, which is crucial for the growing number of plant owners.

Based on the market research and statistical data conducted, the key problems identified are:

1. **Inaccuracy in Diagnosis**: Many existing plant care tools rely on user input or general symptom-based analysis, which can lead to inaccurate results and poor guidance for plant owners. As reported by the National Gardening Association, 35% of plant owners struggle with diagnosing plant diseases, and a lack of reliable diagnosis tools makes it harder to treat plants effectively.
2. **Time-Consuming Research**: Plant owners often spend excessive time researching plant diseases or waiting for expert advice. A survey from the Royal Horticultural Society found that 40% of plant owners spend over an hour each week researching how to care for their plants. This time could be better spent on proactive care if faster solutions were available.
3. **Limited Scope of Existing Tools**: Many current tools focus only on common issues, like pests or fungal diseases, without considering more complex or early-stage health problems. Additionally, they often fail to provide personalized advice based on individual plant species, environmental conditions, or plant history. According to the American Horticultural Society, 60% of plant owners have limited access to gardening experts, particularly in rural areas.
4. **Inaccessibility of Expert Advice**: Professional consultations can be expensive or time-consuming, especially for non-experts. The American Horticultural Society notes that 60% of plant owners in rural areas lack access to professional gardening advice. This creates a significant barrier for consumers who need affordable and accessible plant care assistance.

5. **Need for Preventive Measures**: Many tools focus on diagnosing plant health issues after they occur, rather than providing proactive solutions or early detection. Early detection of plant diseases can reduce crop loss by up to 30%, as shown by research on agricultural diseases. Yet, most consumer-grade tools do not offer this kind of preventive or predictive care.

Task 1.2: Stakeholders

- Create a list detailing each stakeholder's characteristics, encompassing aspects such as their power, influence, interest, expectations, needs, and preferences. Provide clear justifications when identifying stakeholders' power, influence, interests, expectations, needs, and preferences.

- Using the above information, prioritize and categorize stakeholders within the *Business-to-Consumer Power-Interest Matrix* (Figure 1). Explain the relationship between stakeholders and their respective **.**
SUBJECTS (Low Power, High Interest) – Plant Owners (Individual Users)
- **Position**: These users have high interest in the product but little power to influence its development or business decisions. They are the main consumers whose needs and feedback drive the product's success. The product must focus on addressing their needs for usability, accuracy, and convenience.
- **2. PLAYERS (High Power, High Interest) – Garden Centers & Large Retailers**
- **Position**: Garden centers and large retailers have both high power and high interest. They can significantly influence the product's success by endorsing it, integrating it into their sales strategies, and providing access to a large consumer base. They must be kept engaged and satisfied for market penetration and adoption.
- **3. CROWD (Low Power, Low Interest) – Professional Gardeners & Botanists**
- **Position**: While these stakeholders have specialized knowledge, their direct involvement with the app is minimal. They do not drive its success but could help with its credibility and scientific validation. The product should not focus heavily on them, but their feedback could be valuable for refining accuracy.
- **4. CONTEXT SETTERS (High Power, Low Interest) – Technology Developers, Investors & Business Partners**
- **Position**: Technology developers, investors, and business partners hold high power over the product's direction, funding, and technical development but have low interest in the actual plant care aspect. They must be aligned with the product's long-term goals, focusing on profitability, technical scalability, and market viability.

- Identify **the main stakeholder** and explain their needs, priorities, and expectations, as well as the reason behind their need to solve the problem. Explain why it will be **beneficial** for the company to address this problem, focusing on this "main stakeholder". Use statistical data and justifications to support your answers.

- **Main Stakeholder: Plant Owners (Individual Users)**

  Needs:

- **Accurate Diagnosis**: Plant owners need an accurate way to diagnose plant health issues. They often struggle to differentiate between various plant diseases or conditions.
- **Ease of Use**: They need a user-friendly interface that requires minimal effort to upload a photo and receive immediate feedback.
- **Quick Feedback**: Speed is crucial for plant owners, especially when they need to act fast to save a plant from deteriorating. They expect instant or near-instant results.
- **Personalized Advice**: Plant owners need tailored advice based on the specific species, environmental conditions, and stage of their plant's life.

  Priorities:

- **Accuracy**: Plant owners prioritize the correctness of the diagnosis. If the diagnosis is wrong, they might use the wrong treatment or care, which could harm the plant.
- **Usability**: They prefer simple, easy-to-use tools that do not require technical knowledge.
- **Time-Saving**: They want a solution that saves time compared to traditional methods (like online research or waiting for expert advice).
- **Cost-Effectiveness**: As the product is intended for a broad market, affordability is a priority for plant owners, especially for those who are budget-conscious.

Expectations:

- **Reliable and Fast Diagnosis**: Plant owners expect a fast, reliable tool that provides precise health diagnoses. They also expect the model to be able to diagnose a wide range of plant issues, from minor symptoms to severe diseases.
- **Personalized Recommendations**: Based on the diagnosis, plant owners expect actionable advice that's tailored to their plant species, growth stage, and environment.
- **Low Maintenance**: The product should not require significant effort from users to maintain or update. Once it is set up, it should run seamlessly with little input from the user.

Reason Behind Their Need to Solve the Problem:

- **Improved Plant Care**: Plant owners are passionate about caring for their plants and often form emotional attachments to them. Without proper care, plants can die, leading to disappointment and a lack of confidence in their plant care abilities. As a result, they want a reliable way to diagnose and treat plant health issues.
- **Time Constraints**: Many plant owners do not have the time to manually research plant diseases or seek expert advice. They need a solution that allows them to quickly assess plant health and receive guidance.
- **Growing Interest in Plants**: The trend of indoor gardening and plant care is on the rise, particularly among Millennials and Gen Z. As reported by the National Gardening Association, 70% of Millennials and Gen Z in urban areas have started indoor gardening. This growing interest requires tools that make plant care easier and more accessible.

Why it is Beneficial for the Company to Address this Problem:

- **Market Demand**: There is an increasing demand for simple, effective, and accessible plant health tools. According to a 2021 survey by the National Gardening Association, over 40% of plant owners feel they need more guidance in plant care. Addressing this demand presents a significant market opportunity.
- **Scalable Solution**: By focusing on plant owners, the product has a large and scalable market, especially as more people become interested in gardening. As the trend of indoor plants continues to rise, the user base for the application will likely grow exponentially.
- **Customer Retention**: If the product meets plant owners' needs for accuracy and ease of use, it can create long-term customer loyalty. A satisfied customer is more likely to continue using the product and recommend it to others, leading to increased adoption and retention rates.
- **Monetization Opportunities**: Focusing on the plant owner demographic opens up opportunities for monetization, such as offering premium services (e.g., personalized plant care plans), partnerships with gardening retailers, or data analytics services for plant care.

Supporting Data:

- **Plant Care Struggles**: A 2020 survey by the National Gardening Association found that 35% of plant owners struggle with diagnosing plant diseases, which highlights a significant gap in the market for accurate diagnostic tools.
- **Time Spent on Plant Care**: According to the Royal Horticultural Society, 40% of plant owners spend more than an hour each week researching how to care for their plants. This indicates a demand for more efficient, automated solutions that save time and effort.
- **Popularity of Indoor Plants**: A 2021 survey by the National Gardening Association found that 70% of Millennials and Gen Z in urban areas are involved in indoor gardening, further confirming the growing need for solutions to manage plant health.

• **SUBJECTS**
Low Power, High Interest
• **Plant Owners (Individual Users)**
  ○ **The largest user group**
  ○ **Require accurate care information and ease of use**
  ○ **The application's success depends on their engagement**
	• **PLAYERS**
	High Power, High Interest
	• **Garden Centers & Large Retailers**
	  ○ **Can promote the product to customers**
	  ○ **Expect accurate data and integration support**
	  ○ **Can drive market expansion**

• **CROWD**
Low Power, Low Interest
• **Professional Gardeners & Botanists**
  ○ **Can contribute to scientific accuracy**
  ○ **May not use the app frequently, but expert opinions matter**
  ○ **Expect detailed reports and data**
	• **CONTEXT SETTERS**
	High Power, Low Interest
	• **Technology Developers, Investors & Business Partners**
	  ○ **Develop the application's infrastructure**
	  ○ **Define technical and financial aspects**
	  ○ **Expect high data quality and scalability**

Figure 1. *Power-Interest Matrix*

Task 1.3: DAPS Diagram

Create and fill in the DAPS Diagram for your project using the knowledge acquired in Tasks 1.1 and 1.2. Insert the DAPS Diagram **here.** Make sure to complete the lower part of the DAPS Diagram: *the data-analytic problem*, the middle part: *the decision framework*, and the upper part: *the business value.*

Task 1.4: Idea Generation

Define the main idea for your application and align it with your market research, business value, and consumer needs.

- Thoroughly explain and justify your idea, starting with the problem definition and its link to the final product.

- **Problem Definition:**

Plant owners struggle with identifying plant diseases, understanding care instructions, and tracking plant health. This leads to improper plant care, resulting in plant decline. There is a lack of easy-to-use, reliable resources for plant diagnostics and care.

- **Consumer Needs:**
- **Ease of use:** Simple platform for plant health assessments.
- **Real-time support:** Instant care recommendations based on plant conditions.
- **Educational content:** Clear, actionable plant care instructions.
- **Scientific accuracy:** Reliable, trusted information.

- **Business Value:**

The app aims to **increase user engagement** by 20% in 6 months by providing personalized, real-time diagnostics and care advice.

- **Idea Justification:**

The app will use **image recognition** to diagnose plant health issues and provide **personalized care instructions**. It will be a simple, accessible solution that meets the needs for real-time support, ease of use, and reliable information.

- **Final Product:**

A **mobile app** that allows users to take plant photos, diagnose issues, and receive personalized care advice, helping plant owners maintain healthy plants and increase user engagement.

- Explain how your final product will address the needs of your main stakeholder.
- The main stakeholder is **plant owners**, who need an easy and reliable way to diagnose and care for their plants.
- **Ease of Use:** The app will feature a simple interface, where plant owners can easily upload images of their plants. The process will be quick and intuitive, allowing users to access plant care recommendations without difficulty.
- **Real-Time Support:** The app will provide instant feedback on plant health, delivering immediate care instructions based on the image analysis. This allows plant owners to take prompt action, improving plant health and preventing deterioration.
- **Educational Content:** By offering detailed care instructions and plant disease information, the app educates plant owners on how to maintain their plants better, addressing knowledge gaps.
- **Scientific Accuracy:** The app uses AI and image recognition for accurate diagnoses, ensuring that plant owners can trust the care recommendations.
- In summary, the app directly addresses the plant owners' need for accessible, reliable, and real-time plant care, improving their plant-keeping experience.
- Provide and explain the business value that your application will deliver to the company or industry.
- **Increased User Engagement**: By offering instant, personalized plant care advice, the app will encourage frequent usage, leading to a 20% increase in engagement over 6 months. Continuous interaction with the app helps build a loyal user base.
- **Enhanced Customer Satisfaction**: With accurate, AI-powered diagnoses and actionable care recommendations, the app improves the overall user experience. Satisfied customers are more likely to recommend the app to others, contributing to word-of-mouth growth.
- **Market Expansion**: The app's ability to provide a simple solution to plant care opens opportunities for partnerships with **garden centers**, **retailers**, and **plant care product brands**, leading to wider market reach and additional revenue streams.
- **Data-Driven Insights**: The app will collect valuable data on plant health trends, which can be used for market research, product development, and targeted marketing strategies.

Scalability and Long-Term Vision

- To ensure long-term usability and growth, the application is designed with scalability in mind. In its initial version, users manually upload plant images via mobile or web platforms. However, the system can evolve by integrating with smart gardening devices, such as IoT-enabled cameras or environmental sensors. These integrations will allow for automated, real-time plant monitoring without user input.
- On the technical side, the app will be supported by scalable cloud infrastructure to handle increasing user data and to retrain models regularly with new images. This ensures the model can continuously improve and adapt to various plant species and health conditions as the user base grows.
- This scalability will not only support larger audiences but also open up opportunities for B2B partnerships, such as with gardening product companies, smart home platforms, and agricultural service providers.
